Alert Triage Practice Report

1. Objective

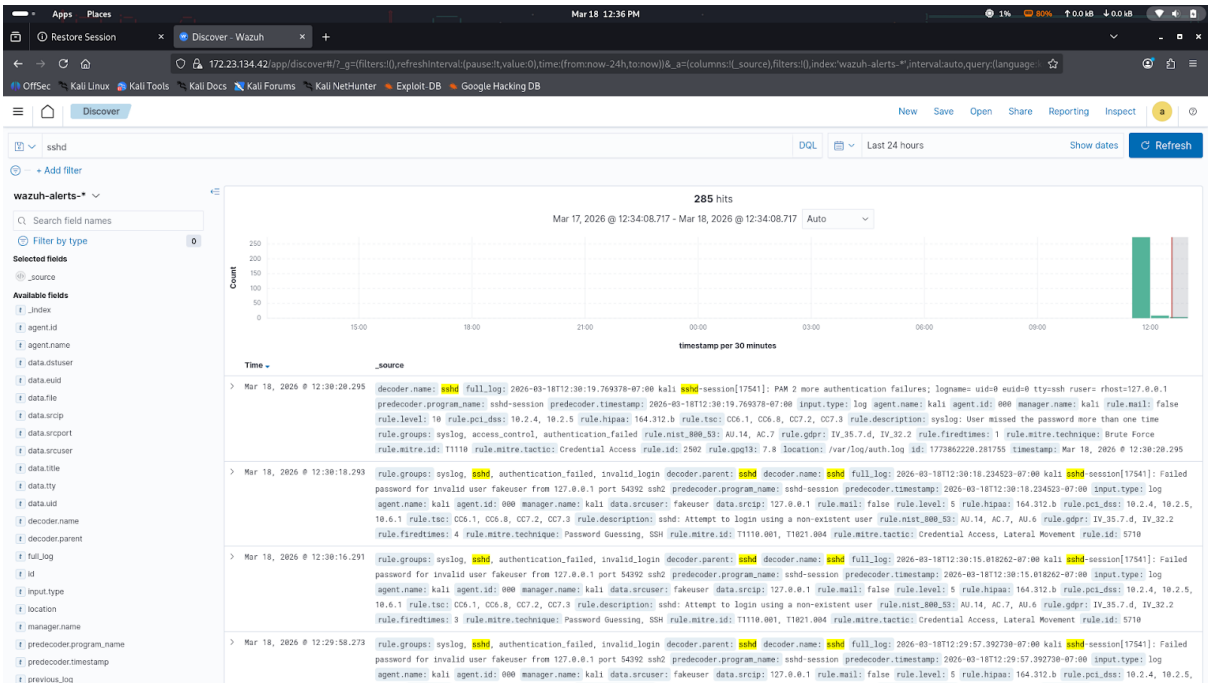
The objective of this task is to simulate alert triage using Wazuh SIEM, validate the alert using threat intelligence sources, and determine whether the alert is a true positive or false positive.

2. Alert Classification

- **Type:** Authentication Attack
- **Technique:** Brute-force SSH
- **MITRE ATT&CK:** T1110 (Brute Force)
- **Severity:** Medium

3. Alert Details

Alert ID	Description	Source IP	Priority	Status
002	Brute-force SSH	127.0.0.1	Medium	Open



4. Alert Analysis

The alert was triggered due to multiple failed SSH login attempts detected on the system. These attempts were generated by repeatedly trying to log in using invalid credentials (e.g., `ssh fakeuser@localhost`).

Key indicators observed:

- Multiple "Failed password" logs
- Same source IP generating repeated attempts
- Authentication failures within short time interval

This behavior is consistent with a **brute-force attack pattern**.

5. Threat Intelligence Validation

The source IP address was checked using:

- VirusTotal
- AlienVault OTX

Steps performed:

1. Copied the source IP from Wazuh alert
2. Searched the IP in VirusTotal
3. Searched the IP in AlienVault OTX

6. Threat Intelligence Summary (50 Words)

The analyzed IP address did not show strong malicious reputation in VirusTotal or AlienVault OTX. This indicates that the activity is likely generated within a controlled lab environment. The repeated failed login attempts confirm brute-force behavior, but it is a simulated attack rather than a real external threat.
